Executive Summary

T3AM's To-Do List is a web application that allows users to create numerous tasks for themselves within three categories: Home, Work, and School. This project involved coding in languages such as HTML, Javascript, and CSS to ensure that the application functions properly. While no algorithms were utilized in the making of the project, a database connection was available to store important data. This collection of data is vital to the functionality of the application, which includes: logging in to a user account, creating a task, editing a task, and inputting the proper information about each specific task. The team has continuously tested the code for the project by debugging errors and thinking of solutions to possible problems. Further testing such as unit testing and integration testing were performed at the closing of the project. User stories containing roles such as user, developer, and designer were also created to ensure every perspective of the project's functionality and usability is available.
